

How Did Our Project Go?

For our first I2 project, our project was pretty solid. We did what we wanted to accomplish in the end. We made a website and a digital model of what we wanted or think a new innovative streetlight would look like. We have learned so much off this one project and what not and what to do next year. Overall, our first I2 project was successful and gives us knowledge of what we need to do next year.

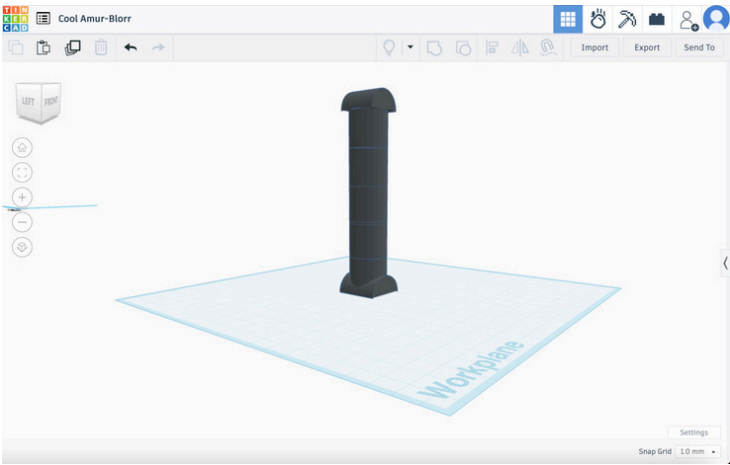

Our Timeline

At the start of the project Jude and I were brainstorming ideas of what topics we could research about. After talking and thinking about it we landed on A new and improved streetlight that would used recycled materials and produce less greenhouse gasses.

Before Christmas, To do this we researched ways on how we could build and make this new streetlight. At first we thought of ways we could make this project come to life so we thought we could build a prototype of it.

As we were thinking of what we needed to do to accomplish this we realized that we didn't have the engineering or building skills to pull it off. The things to put this together would also cost us a lot. So, we decided to go away from building a model of our project.

After Shark Tank we decided that if we couldn't make a physical model then we should make a digital one. So we decided to make a webstie explaining our proposal of the streetlight. It has information of what its made of and a mini model of how it might look. Flash forward to today where you are learning about our project.

This is a picture of when were jexperimenting on how the digital model would look like. (Very Beginning so it looks horrible)
